* _**Macintosh:**_ Apple introduced Photoshop for Mac in 1987, and now it's on every computer sold with Mac OS X. The program includes the kind of special software used in many fashion and art studios, called the Adobe Creative Suite. ## Taking Advantage of Color By now, you know that graphics programs produce color images: They mix the colors of pixels that are grouped in different colors to create a color picture. If you buy a black-and-white photo, chances are that you're working with what's called a _gray scale_ image — the pixels aren't of any one specific color. A _color image_ (as in a photo or a drawing) is any image with a color picture. The _RGB color space_ is a standard for color computer images. The RGB color space contains three components: the _red, green,_ and _blue_ components that form the color. If you were to add two different colors to a pure gray scale image, the result is gray. This brings us to the next issue: * **Color Grading:** Understanding how to change color is an important skill, especially if you want to make adjustments to color images for printing or visual effects. Photoshop offers three ways of adjusting color: Levels, Curves, and Adjustment Layers. The following sections cover these tools.

What's New In Adobe Photoshop 2022 (Version 23.0.2)?

Q: How to generate a vector of coordinates relative to an origin image I have a chessboard image in a PIL image, and then I have lines that run through the board. I want to be able to measure the distance between each of the lines and the bottom edge of the image. I plan to generate a vector that shows all the locations of the lines. The way I am right now is to draw the squares of the board and then generate a list of points relative to the position of the image. I can then iterate through the coordinates of the points and calculate the x and y values of each point. This sounds like a super easy task, but the image I have is 400x267 and the coordinates are not aligned with the board. I think this is causing me to lose precision. Is there any way to generate a vector of coordinates that are relative to the position of the image? edit: here is a snippet of the chessboard image I'm using: A: This is what I came up with based on comments: from math import sqrt, cos, sin, tan image = Image.open('chessboard.png') board_width = image.size[0] def find_coordinates(p0, p1): points = [] dx = p0[0] - p1[0] dy = p0[1] - p1[1] t = sqrt((dx ** 2) + (dy ** 2)) dy = dy / t k = 0.1 h = dy / k x0 = dx * h x1 = dx * (1 - h) while k
