Adobe Illustrator Adobe Illustrator was originally designed to produce vector graphics. Vector graphics are characterized by the lack of jagged edges. Instead, the lines inside a vector graphic are a mathematical construct. While Vector graphics are the foundation for all graphic design, Adobe Illustrator goes far beyond this and can be used to create even highly

complex animation. In some respects, Adobe Illustrator is the designer's equivalent of a spreadsheet—it can organize and manipulate thousands of various graphic elements. This makes Adobe Illustrator the most popular vector-based program, with many tutorials, books, and magazines devoted to it. Adobe Illustrator has been the industry standard for animation graphics since the 1990s and is still the most popular tool used to create and animate a variety of different effects.

Adobe Illustrator is available in three different programs: * The Standard version is similar to many other popular programs like CorelDRAW and Microsoft PowerPoint, but it comes with many more features than either CorelDRAW or

PowerPoint. * The CS2 version is the "Premier" version, which includes all of the features of the Standard version. * The Premium version, or CS3, is designed for professionals and includes many more features than the Standard version.

Adrenergic innervation of the
human Fallopian tube: labelling with
methoxyveratrine. Methoxyveratrine (MV)
was used to label alpha-adrenoceptors in
the secretory epithelium of the human
Fallopian tube. The technique was shown
to be specific and sensitive with respect to
the antagonistic alpha-2-receptor ligand
yohimbine. The density of muscarinic
M1-receptors, as visualised by glycyrrhizic
acid (a specific ligand of these receptors),
was not different in the secretory and non-
secretory epithelial cells of the Fallopian
tube. The alpha-adrenoceptors in the
secretory epithelium are of the

alpha-1-type. The finding that the density of these receptors, as quantified by light microscopical autoradiography, is slightly reduced in women with tubal ligation shows that there is no difference between virgin and parous women. In contrast, the density of beta-adrenoceptors increases significantly in the secretory epithelium of parous women. The beta-adrenoceptor density appears to be reduced in decidualized endometrium.
